Retention is the growth lever we are underusing

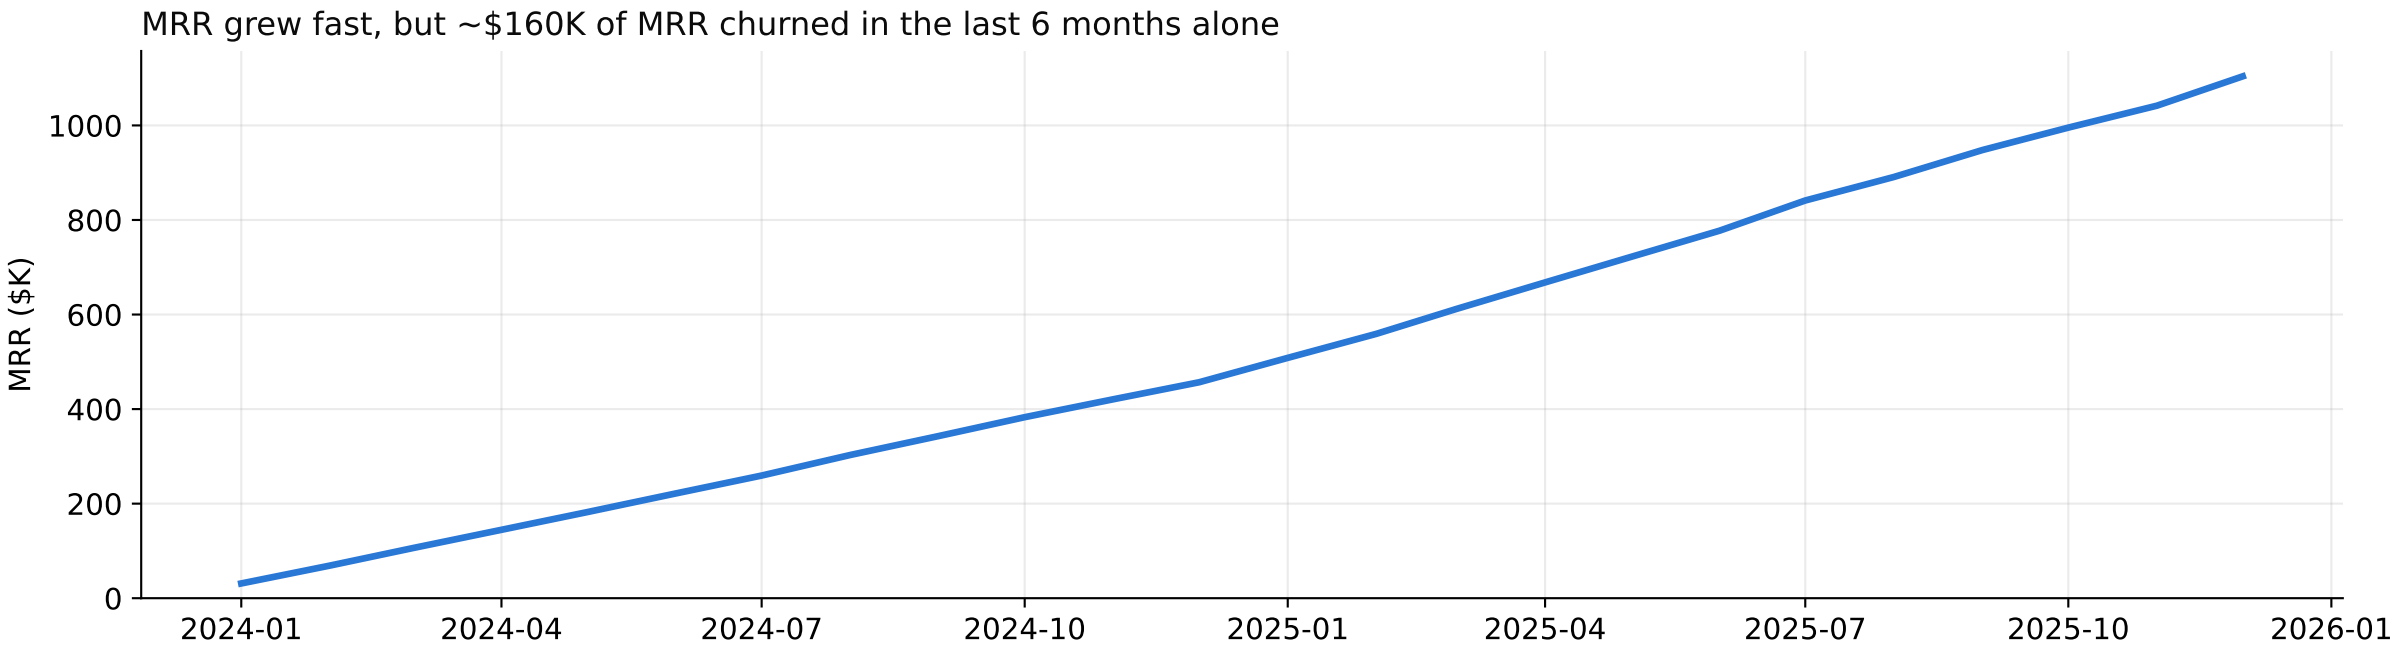

We acquire customers efficiently in some channels, but lose a third of new logos inside six months.

$1.10M
MRR (Dec 2025)

6,203
active customers

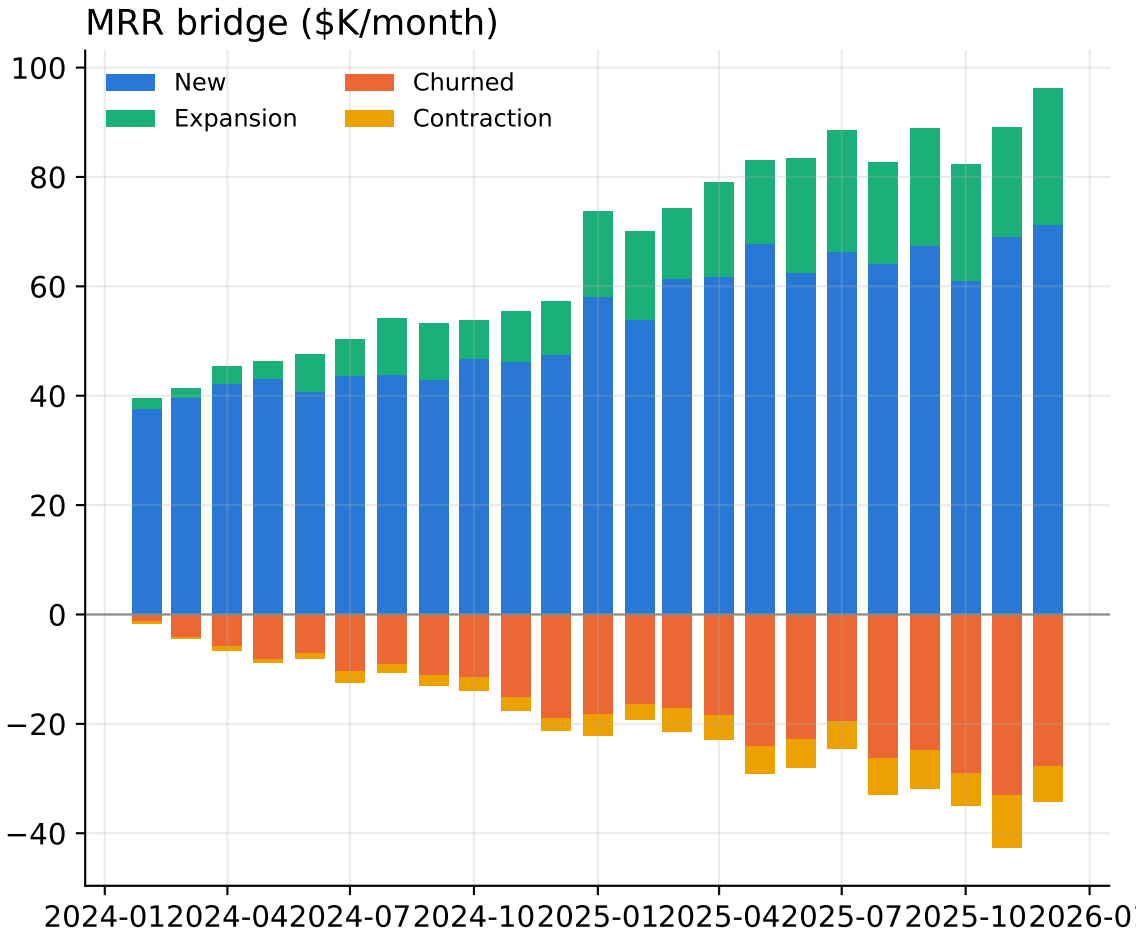

4.6%
monthly logo churn

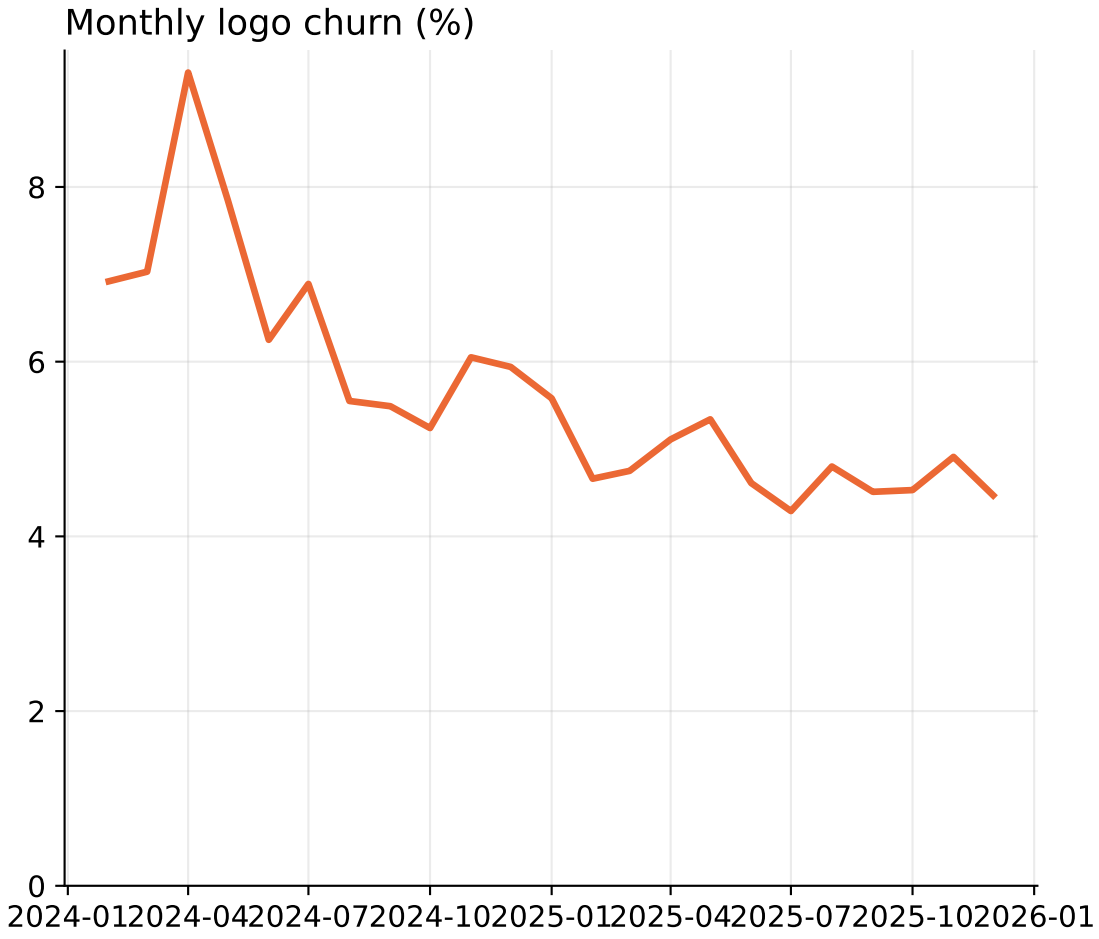

32%
of new customers gone in 6 months

New customers are the leakiest bucket

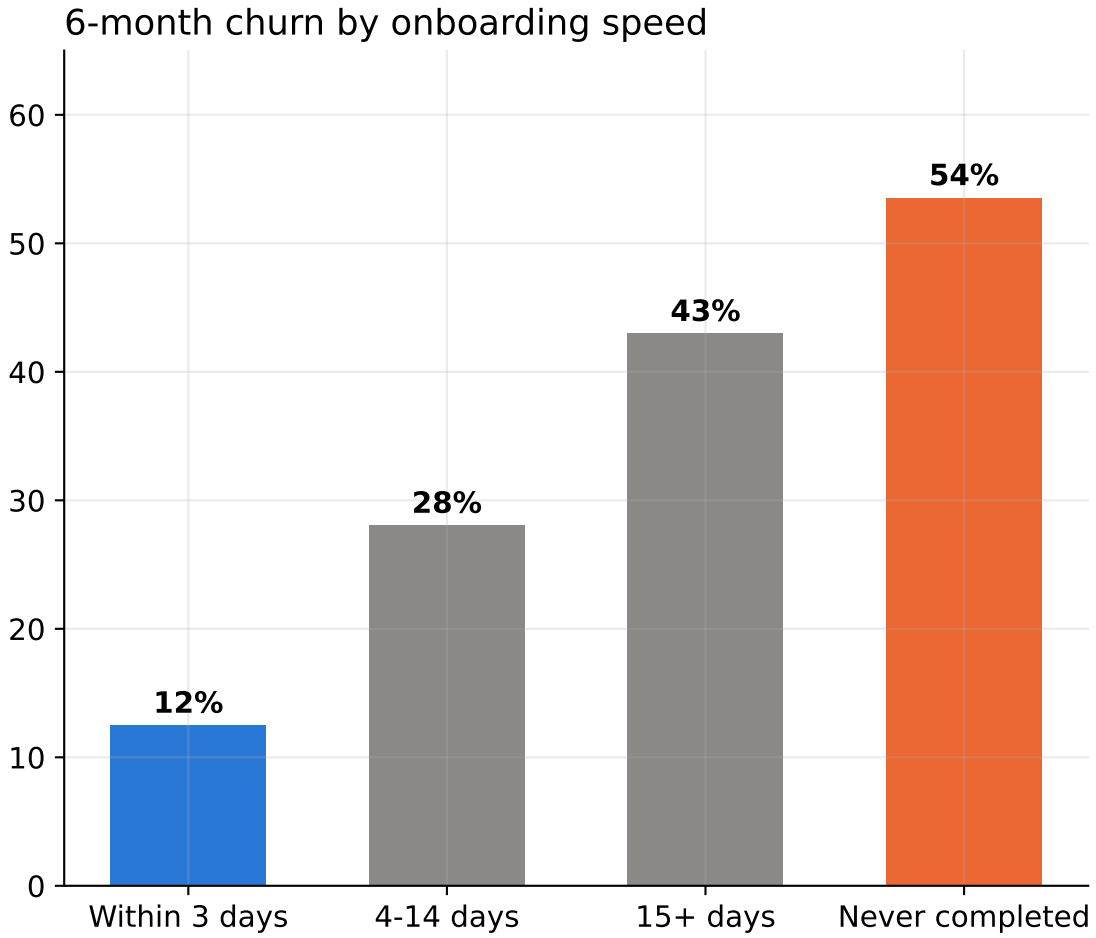

Only 68% of a cohort is still paying at month 6 and 56% at month 12.

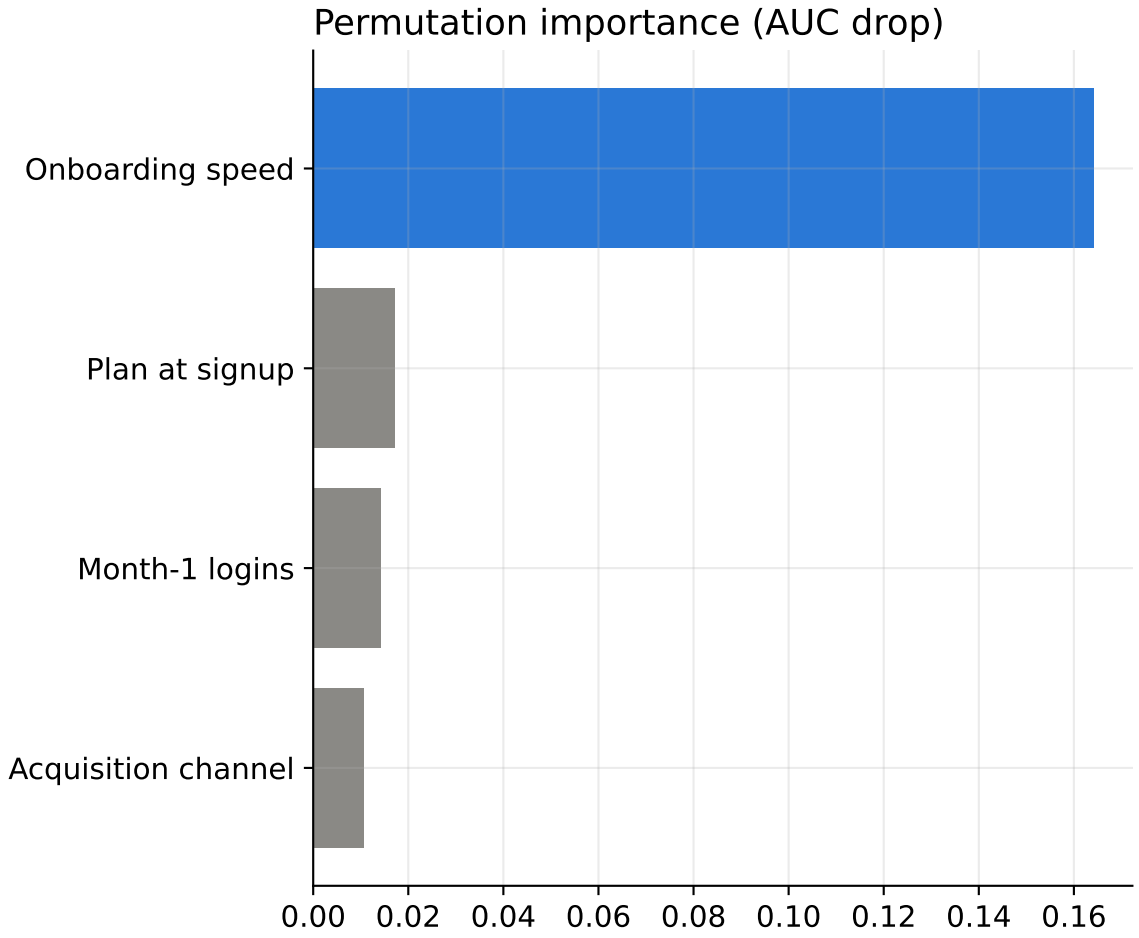

Onboarding speed is the strongest early churn signal

Customers who finish onboarding within 3 days churn at 12% vs 38% for everyone else (relative risk 3.0x, 95% CI 2.7 to 3.5).

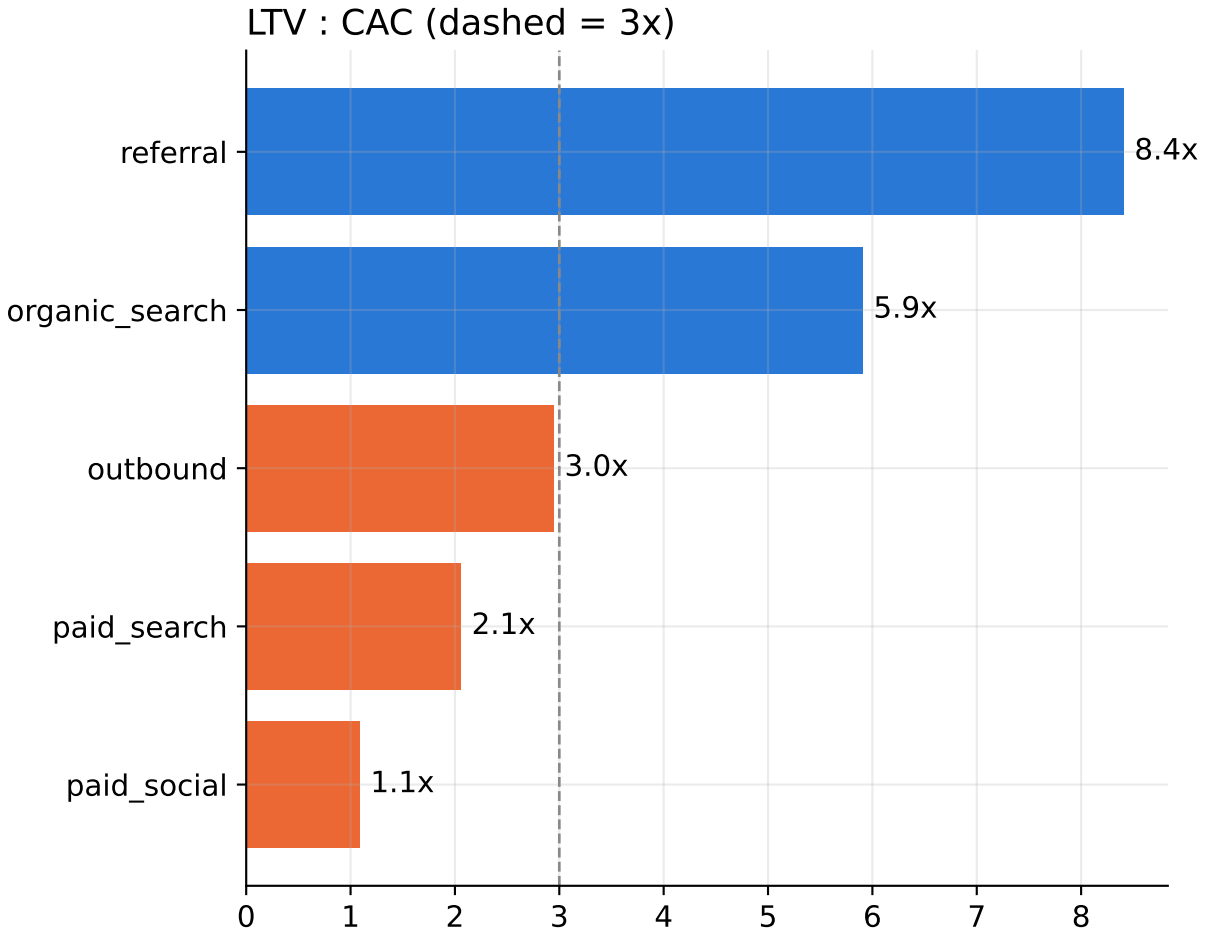

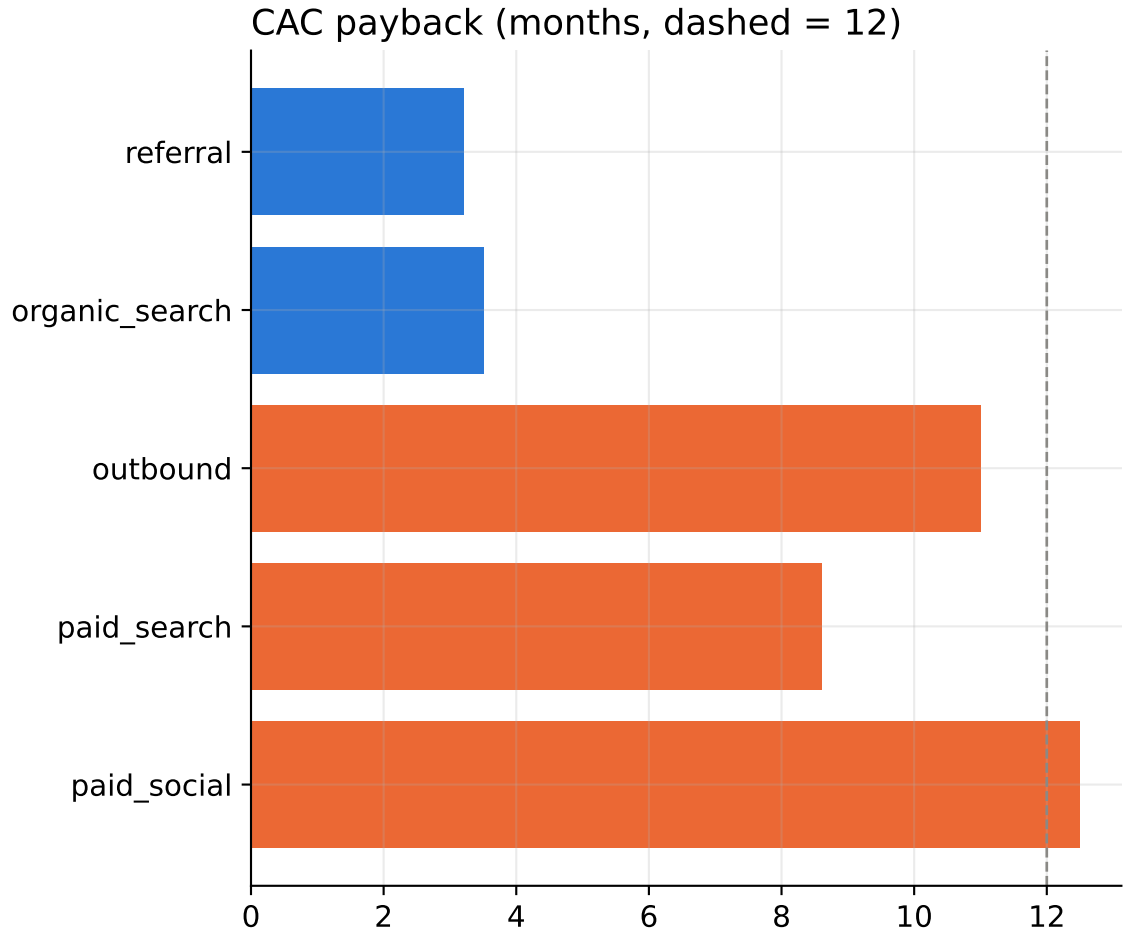

Model: logistic regression AUC 0.76, random forest 0.75 on a hold-out set (n = 6,787 customers).

Not all acquisition dollars are equal

Referral and organic return 6-8x their cost; paid social barely breaks even and takes a year to pay back.

Recommendations and expected impact

In priority order; all figures are modelled estimates with stated assumptions.

1 Guided onboarding programme

Enrol 25% of customers who miss the 3-day window (1,116 per year). At a 50% haircut to the adjusted effect: ~132 extra customers retained, 6-month churn down 2.3 pts, $185K gross profit vs $45K cost (3.1x net ROI). Validate with a randomised pilot first.

2 Reallocate paid social to referral

Move 20% of 2025 paid-social spend ($322K). Net lifetime gross profit +$1.0M even assuming referral converts at half its historical efficiency.

3 Win back at-risk accounts

524 high-value accounts (4.4% of MRR, $48K/month) show falling recency and frequency. Saving 20% protects ~$116K of annual revenue.

Next steps

Run the onboarding pilot as an A/B test (see companion project for design and sizing); add a day-30 risk score to the CS queue; review paid-social creative and targeting before cutting further.
